Conductive polymer - Wikipedia

Conductive polymers or, more precisely, intrinsically conducting polymers (ICPs) are organic polymers that conduct electricity. Such compounds may have metallic conductivity or can be semiconductors. The biggest advantage of conductive polymers is their processability, mainly by dispersion.

Conjugated polymers - ScienceDirect

The unique electronic properties of conjugated polymers derive from the presence of π -electrons, the wave functions of which are delocalised over long portions of (if not the entire) polymer chain, when the molecular structure of the backbone is (at least approximately) planar. It is necessary that there not be large torsion angles at the single bonds, for example, joining aromatic groups of

Electronic and Optical Properties of Conjugated Polymers ...

William Barford's *Electronic and Optical Properties of Conjugated Polymers* is a theoretical complement to the high experimental culture of British research on conjugated polymers. Currently, the semiconducting properties of undoped, conjugated polymers are the focus of that research interest.
